The genetic code. The first step in decoding genetic messages is transcription, during which a nucleotide sequence is copied from DNA to RNA. The next step is to join amino acids together to form a protein. The order in which amino acids are joined together determine the shape, properties, and function of a protein.

Ribosome is the enzyme that catalyzes protein synthesis. Ribosome has 2 subunits - the large and the small. The large subunit is responsible for the peptidyl transfer reaction. The small subunit is responsible for the recognizing mRNA and binds to the Shine-Dalgarno sequence on the mRNA (Kozak sequence for eukaryotes).

Protein Synthesis - MCAT Review

Proteins form structures, enzymes, or other chemicals to create the building blocks of organisms and maintain homeostasis. When a cell needs to make a protein, say the enzyme to digest lactose (the sugar in milk), it needs to use/read the DNA code to make proteins. We call this process protein synthesis.
